

ABSTRACT OF THE DISCLOSURE

Each of spacers which defines an interval
between substrates composing an envelope is fixed to
the substrates while their linearity is kept by the
5 tension exerted therein. In the fixation, it is set
such that a fixing point of each of the spacers is
located between points on which the tension is
exerted. Thus, even when the tension is released,
the linearity is maintained, so that a displacement
10 of each of the spacers can be prevented to kept a
high assembly accuracy.
